Ventricular dimensions at birth and in infancy: interrelationships, associated conditions, and risk factors. To analyze the magnitude and interrelationship of ventricular dimesion (VD) at birth and in infancy with diagnosis of associated congenital abnormalities, anthropometric measurements, and risk factors for prematurity. A population-based, retrospective cohort study in a well-defined population of newborns in southern Brazil. VDs were measured in utero at birth and by echocardiography at infancy (n=1432). Median (P(25)-P(75)) maternal age was 27 (24-30) years and the median (P(25)-P(75)) gestational age was 36 (35-37) weeks. The incidence of VD > or = 8.0 cm and > or = 5.0 cm was 3.5% and 2.9%, respectively, at birth. We observed an incidence of 3.2% (95% CI: 2.1-4.5) of VD > or = 10 cm. The median (P(25)-P(75)) height-for-age z score was -2.4 (1.0-3.6). We observed a significant reduction in VD with preterm birth. Birth weight and gestational age were independent risk factors for abnormal VD. VD at birth and in infancy was interrelated, but its occurrence was much more frequent in infants with increased cardiac size, suggesting that it may be present as part of a dilated cardiomyopathy. There was also a strong association between preterm birth and abnormal VD. The anthropometric measurements at birth and in infancy were inversely related to normal values. The risk of congenital heart diseases was higher in infants with VD > or = 8.0 cm, but additional investigations are required to characterize their subtypes.Rice 'Lava Temples' Study Before Inscription By Lindsay Lynton One of the coolest aspects of traveling to such a remote region of the globe is getting the chance to see an incredible range of unique features just one step away from a busy highway and perhaps much closer to a prominent city like Shanghai than one might think.
