

AutoCAD's foundation stems from the introduction of the first mass market home computer, the Apple II. In early 1983, Autodesk began development of AutoCAD and in the fall of 1983, the AutoCAD I desktop app was introduced. In September of that year, a bundle of the first 100 AutoCAD units were sold for US\$200. This price was well below the price of the desktop graphics terminals (GXT) that were required to run AutoCAD. Consequently, within a few years Autodesk had sold over a million AutoCAD units. From 1984 to 1992, AutoCAD continued to evolve. The most visible changes, such as the introduction of bounding box and snap to grid, happened during this time. In 1995, Autodesk re-released AutoCAD as a PostScript RIP (raster image processor), which began the transition to AutoCAD from an internal graphics display system. From 1996 to 2001, AutoCAD continued to evolve, although the most visible changes were also internal. In 1999, AutoCAD began to support vector graphics. The application has continued to evolve over the past 25 years with major releases occurring approximately every two years. The initial release of AutoCAD was a DOS application, but a Windows version was also made available as early as 1994. An OS X version was released in 2016. AutoCAD is a highly popular CAD software application for use in both design and engineering. AutoCAD's user base is estimated at over 4 million and its user community is active. The user community for AutoCAD includes corporate design and engineering teams, individual artists, architects, and users of specialized computer-aided design (CAD) applications such as the ArchiCAD, TurboCAD, VectorWorks, SketchUp, MicroStation, and SimMechanics. From 1983 to 2015, Autodesk sold its consumer-focused AutoCAD products through its AutoCAD franchise. In 2015, Autodesk spun off the AutoCAD franchise, including the desktop AutoCAD and the VectorWorks desktop and engineering products, to fellow former DECS system vendor Corel. Autodesk subsequently sold AutoCAD to French firm HEC Paris in 2016. The architectural, construction, civil engineering, manufacturing, mechanical, and product design software programs used by the organizations listed above are largely proprietary, allowing for only limited integration with other software programs. They generally do not provide native support

command and control, data exchange Mechanical and electronic automation systems were developed for specific applications, the most common being: mechanical positioning systems, often used in manufacturing, where moving parts are positioned relative to each other or a machine tool. Mechanical automation systems can be classified into: pure mechanical, which uses a direct interface to the machine, for instance a servo controller controlling a robot arm. position and orientation, which uses position information to move parts, and orientation information to orient them. Examples are machine tools, where, for instance, the tool is moved and the direction of the tool-axis and cutting edge are adjusted. pneumatic and hydraulic control systems, which use air and hydraulic power to move parts and apply force. electrical power, which uses electrical power for moving parts, applying force and sensing the state of the system. In the last years, there has been a large growth in data exchange between companies using different applications. For instance, companies that are building an office building may submit a CAD file of their construction plans to an application that creates an integrated 3D model. On the other hand, a construction company may want to submit the assembly instructions for the furniture that is part of the office building. The instructions may contain information on the size of the components, quantities, etc., which would allow the assembly instructions to be run on a CAD application that provides information on the dimensioning of the furniture components. The new large data exchange is resulting in the increase of the software companies that develop the applications. The increase in companies developing applications also leads to an increase in the availability of integration between applications, e.g. AutoCAD and Matlab (a matrix programming language). Applications There are more than 11 million CAD applications listed on the application store Autodesk Exchange Apps. Currently, the leading software companies developing CAD applications are: Autodesk, 3D CAD, Autodesk Analytics, Autodesk Maya, Autodesk Motion Builder, Autodesk Architectural Designer, Autodesk Land Desktop, Autodesk Inventor, Autodesk Civil Design Suite, Autodesk AutoCAD Architecture, Autodesk AutoCAD Electrical, Autodesk AutoCAD Civil 3D, Autodesk Project (formerly called RealDWG) Dassault Systemes, Civil 3D, Windchill, CATIA, SIMULIA Hitachi, PLM, Streamline, AutoCAD, Grand Prix, ProjectW ca3bfb1094
