the information that makes up a digital image. This includes the pixels that make up the digital photograph—the pixels that make up the color of the photo on your monitor. Photoshop's layers are a way to organize your edits. Layers are considered the building blocks of any image, and the best way to make a photo look good is to apply different layers to an image, either to lighten or darken specific areas of an image, cut and paste portions, and perform other edits. After you

create or import a new image, you have to save it into one of Photoshop's many file formats before you can begin to play with the layers. Photoshop suggests working with the file format that is most common and most powerful, which is Photoshop's native PSD file format. It enables you to make changes to an image in any format—even ones that don't store layers, like JPG or PDF. Adobe Photoshop Tutorials for Beginners If you're new to Photoshop, you don't need

Preliminary studies on the development of the mandible in the fetal period of the human. The maxilla and mandible are fully ossified by the 20th and 21st week of gestation, respectively. The mandible is underdeveloped until the 17th week, and bone tissue has not been seen in the

mandible until the 20th week. This study was undertaken to evaluate the mandible in the fetal period of the human. A total of 3,222 human fetal mandibles were studied in situ from 17 to 24 weeks of gestational age. The fetal mandibles were stained using alcian blue and alizarin red. During the 24-week period, the size of the mandible changes little; the gnathion line changes slightly in width until the 19th week, but the form of the mandible changes significantly. At 17

weeks, both the superior and inferior surface of the mandible were covered by bone tissue, but the mandible remained without bone tissue until the 20th week. The development of the bone of the mandible becomes complete by the 22nd week. At 17 weeks, the outline of the lower margin was seen in the mandible, and a small notch was seen between the inferior margin and the inferior alveolar nerve canal. At 19 weeks, a metaconid line had been formed, and at 21 weeks,

the mandibular plane had become prominent, and a region of horizontal bone had been identified on the inferior surface of the mandible. The inferior alveolar nerve was also identified. From the 21st week on, the mandible may be recognized as a part of the skeleton.Q: How to convert a list into a dict?
