The S&P 500 is up 0.6% to 2,087.30 and the Dow is up 1.1% to 22,693.91. The Nasdaq is down 0.7% to 6,622.51. Volume: S&P 500 -1.70B, NYSE- 1.29B, NASDAQ -1.96B, Dow 0.84B. No. 1 US manufacturing index rose to the highest level since July, while a new Canadian PMI reading showed a bounce back from a historic low. Volume: S&P 500 -1.25B, NYSE- 2.03B, NASDAQ -1.95B, Dow 0.54B. The article below is sponsored by Bitcoin, which is right now at \$2486.97. The article fails to mention the rise that began in June at \$2,120.00. It is nothing more than an unregulated, unregulated Ponzi scheme. Further, less than a week ago, someone almost duped me to join Bitcoin. He was old, poor and desperate for a way to get money and I was generous. It is a scam. Locate the man behind this scam. Volume: Nasdaq -1.

A murine in vitro assay system was used to assess the respiratory toxicity of para-dichlorophenol (PDC) and to compare PDC toxicity with that of several other chemicals. Analysis of alveolar macrophages exposed to PDC demonstrated that PDC induced metabolic effects that reflected toxicity of the chemicals. PDC-induced changes in lysosomal membrane stability and oxidant stress were used as markers of toxicity. The results from this study are compared to previous data obtained in rabbits and human subjects exposed to PDC. These studies indicate that the murine in vitro assay system is a useful tool for toxicological investigations of PDC.1. Field of the Invention The present invention relates to the technical field of

electric control device, and more particularly, to a temperature control device for electronic ballast. 2. Description of Related Art With the development of technology, the modern people have come to use electronic lighting products.

The lighting device usually is connected to a ballast. Because the ballast converts the power of the power supply into a voltage suitable for the lighting device, without affecting the power supply, the ballast can provide a good quality to the lighting device. In recent years, the electronic ballast often has a variable frequency output power module. The variable frequency output power module can increase the output power of the electronic ballast, effectively and efficiently improve the lighting performance of the lighting device. The variable frequency output power module usually includes a switch-mode converter circuit, a feedback signal detecting unit, a temperature detecting unit, a temperature controlling unit, and a feedback signal processing unit. The switch-mode converter circuit is formed of a transformer, a switching element, a capacitor, and other passive components. The feedback signal processing unit can receive and analyze the feedback signal and then further decide the variable

frequency output power mode. The temperature detecting unit can detect the temperature of the ballast, and the temperature controlling unit can control the switching element to adjust the temperature of the ballast to achieve a suitable temperature. However, in the above-mentioned structure of the ballast, when the switch-mode converter circuit is in the shutdown state, the feedback signal detecting unit and the temperature
