March 31, 2020 â€” cherfea 7b17bfd26b Â· February 15, 2022, 4:11 AM. This is not a situation where you, for example, you come to St. Petersburg for three days on vacation, and then you sit at home for another week and do nothing. First, I have no idea how to work remotely. Secondly, it really annoys me that I donâ€™t know how everything will be arranged now. I sit in place and wait for a call from the employer. He should send me on indefinite leave, but for now I have to stay at home and work from home. And how now? I've been challenged once before and sent on vacation.

My question is very simple, but I am stuck on it for some time. Let us suppose I have two vectors  $x$  and  $y$ , and I want to replace element  $x[i]$  of vector  $x$  with  $y[i]$ . I tried both functions below but it doesn't seem to work. In particular, the first one returns "Error using elargchk (line 216) Error in get (line 4) list(list(x = seq(0, 24, by = 6), y = seq(0, 24, : arguments to be replaced: list(x =

---

`c(0, 6, 12, 18, 24), y = c(0, 6, 12, 18, 24))"` and the second one gives: "Error in `apply1(value, p$func, do.NULL,...)` : invalid 'x' type" I hope I made myself clear and that someone can help me to solve this issue. Thanks in advance!

A: Here's an option with base R:

```
set.seed(1) x =
as.integer(runif(100)) y =
sample(20:25, size = 100, replace =
TRUE) rep(x, y) # [1] 1 8 16 25 20 11
19 4 13 6 2 5 20 15 16 12 head(rep(x,
y)) # [1] 1 8 16 25 20 11 19 4 13 6 2
5 20 15 16 12
```

However, what you describe is one way to do it using `Vectorize`:

```
Vectorize(function(x, y) {
  rep(x, y) }, vectorize.args = 'x',
vectorize.default = 'function(x, y)
  rep(x, y)'
```
