That work started around the time the **public beta** of Photoshop in the browser was released to press. And although we were already working on it for quite some time, it wasn't until we opened it up to the public that our team was full speed ahead. It was an exhilarating moment, meeting all the people who were excited to use web apps to build beautiful art. You can feel the team's energy in what we've built and what we're planning on doing over the next few years with it. It's been pretty clear over the years that all the technology we create and experiment with at Adobe has to have a dramatic impact on the world. The result you see on this **click** and **here** is a Web application that we think will be fundamentally faster than traditional software too. It's similar-but-not-quite-the-same to the experience seen in traditional software; you only have to manage your assets once, the experience will be the same no matter what machine you use. When we first looked at the web version, we could see that only the larger applications were available. Later we realized that we were able to navigate to a dropdown that hid all of the hidden features. Also, when the client hid all of the toolbars, we could see that the dropdown was removed to restore them on a per application basis. This is the icon you get when you press on the icon to the far right of the toolbars. We can now see that all of the applications are hidden except for our favorites. If we look in the toolbars under the more menu, we can see that there are all the features that we might use on a more regular basis. When working on the web, we constantly talk to our customers about loading times and the increase it provides us with. When the web application was first released, the loading time was 30 times slower than the desktop application. We were able to reduce this load time to about 4 times slower than the desktop application. The load time to load an image is fast on the desktop application, which is approximately 2 seconds. On the web, unless you have a lot of people on your site, the loading time of an image is anywhere from 6 to 20 seconds. This increased load time is a result of having images altered through HTML and CSS. These changes increase the complexity of the website, which in turn makes a user wait. 933d7f57e6

The Camera Raw feature, which was introduced in Photoshop CC 2017, now works with Adobe Camera RAW and Photoshop. To understand this change, it helps to know how Photoshop CC 2017 works. In the new Camera RAW workflow, Photoshop opens with a square white canvas. Each new image opens from this initial, off-white canvas. To make a new "world" you select a "reference" image from the database of the sensor or your drive. In the new workflow, the "reference" works both as a camera retouching knife or as a heavy Photoshop brush for texture and color. This opening image becomes your unique editing canvas. Consider the new workflow as being fundamentally similar to the old workflow, but now the color and texture are largely created in Camera Raw. As you open further images from that first reference image, the color and texture "inherit" from the reference. There is, however, a difference in how the Camera Raw workflow appeals to someone who wants to edit to an image completely from scratch. In the new workflow, you simply make selections, brush(s) in and use the tools normally associated with an image, for example Adjustment Layers, the Global Lightroom Bracketing, etc. You can then use the preview of the image in Camera Raw to make final refinements.
