There are quite a few things I love about Adobe Lightroom Camera Raw 5.2. First, is the huge performance improvement. I don't like the notes that say the camera is 2.0 with little to no underlining. Yes, it's slower than 3.1, but there are better alternatives in Lightroom, like Focus, that you would rather use. As for raw performance, Lightroom has never been better. Importing, exporting, applying adjustments and all the other actions are 10 times faster. Using Lightroom makes your camera an asset like never before. Second, is the introduction of panorama stitching into the process. I actually prefer the new panorama stitching done in Lightroom, which runs about 15 or 20 times faster than before. It's nice to think that Lightroom has made faster panoramas, but in my mind it's about time. I don't know if you have been reading reviews from the past five or so releases of Adobe's Photoshop and Lightroom, but the technology was spun off into a completely separate program. Lightroom is always keeping pace, and updated faster than they could make 'Photoshop'. Third, is the new view options from the two new buttons at the top of the screen, meaning you can hide unwanted parts of the image and show the good stuff. The application comes with a full assortment of tools and is ready to work with both long and short range connections, as both Apple's 10-pin connector and standard USB-C can be used. This can be a real boon if a dSLR does not come with a compatible high-speed adapter. Additionally, Adobe Photoshop can be used with other iPads without issue.

Adobe Photoshop CC, Photoshop CS, Photoshop Elements, and many other Photoshop family are available. These applications are available and particularly use them for creating images and montages, editing photographs, and processing RAW files.[21] The Adobe Photoshop applications are delivered with a wide range of features in a small package. Some of the key features include the ability to work in the state of the bitmap mode. It can also edit various image qualities. Adobe's simplified retouching tools are true to the "Edit > Enhance > Enhance Exposure" workflow. For example, you can edit the white balance for a specific area of an image. White balance is a key photo editing setting that helps to recraft specific colors in a picture. The ability to create your own custom brushes is one the most unusual but best feature to be inspired by. Basing your work on existing brushes, you'll be able to create highly customized and aesthetically pleasing output. One of the most common (and most frustrating) mistakes artists make is the mislabelling of a file. The ability to label files has been one of the most sought-after new features of Photoshop for the year- ahead. Now, you can label your pictures with actionable information to help keep them organized. You'll also find your favorites as smart shortcuts to help apply and edit your edits without taking your hand off the keyboard. Like other Adobe programs, you can save a file in a new version and then overwrite it with older files without overwriting the original version. This makes moving files back and forth in the production workflow a simple process and avoids the need to back up files.
